

Without Animals, How Many Lifesaving Medicines Could We Live Without?

Animals play an essential role in today's lifesaving medical breakthroughs. Because of advancement in humane medical research, we are now able to replace failing human heart valves with healthy ones from pigs, study the effects of new cancer treatments and develop medicines to better manage diabetes. On average, it takes over a decade to develop new medication, and animals can help speed the development and help assure their health and safety for humans. Without animals, many medical breakthroughs would remain undiscovered. The Animals for Life Foundation celebrates the special bond between humans and animals and their mutual benefits. To learn more or to make a donation to the Animals for Life Foundation, call 614.246.8621 or email afl@ofbf.org.
